## Adjustable according to the Base Material, Purpose, and Work Conditions

# Photocatalyst Coating PALCCSAT® Series

#### Photocatalyst Standard Type Harmless Water-Soluble Coating When the photocatalyst is to be applied to an organic base material, this undercoating is used as a protective layer for preventing the phtotocatlysis process ST-P **Undercoating for Exterior Walls** from occurring directly on the base material. This is mainly used for organic base materials such as coated surfaces and plasterwork. PİAJ This can be used as a topcoat for various exterior walls such as coated surfaces and plasterwork. **Topcoat for Exterior Walls** The undercoating is not needed for inorganic materials such as tiles. MOLD This strongly reacts to room lighting (visible light) resulting effective in sterilization, deodorization, and air purification. PİAJ Silver ion has been added so that the deodorization function can be maintained even during the night. VLAG 光柱端工業会 登録: 2019-0002 사-24/7/2 UV For Interiors In addition to interiors, this can be used as a topcoat for exterior walls that receive thin light. Photocatalyst Clear Type **Highly Transparent Alcohol Dispersion Coating** Alcohol dispersion increases the volatility so that a clear coating can be created. Clear G Clear Type for Glass High hydrophilic property prevents dirt. A highly transparent coating can be created so that the design of the based material is not affected. Clear D Undercoating for Exterior Walls Suitable for dark and glossy base materials. Available for acrylics, tent materials, and organic base materials with high water

- \* The effectiveness of our company's work is guaranteed for at least five years, (Note: Depending on the conditions at the actual site.)
- \* For liquid solution sales, the purchaser takes work responsibility
- (Construction point documents are available at sale separately,)

High transparency can be achieved so that the design of the based material is not

- \* Work training can be provided upon request. (Dispatch work instruction)
- \* Please contact us if more details are needed for the liquid solution

Water-Soluble Titanium Dioxide

Photocatalyst Coating

PALCCOAT

Photocatalyst PALCCSAT continuously dissolves various pollutants, odors, and harmful materials, makes them harmless and creates a more comfortable environment.

We are threatened by various invisible harmful substances on a daily basis. We surrounded by various risks including air pollution from exhaust gas, sick house syndrome caused by building materials, fungi and bacteria that can be harmful to humans, as well as pathogens and viruses that are spread through the air. In addition, dirt, mold, and rain stains on building exteriors, yellowish color of interior wall surfaces, and various odors from tobacco, food garbage, animals, mold, bathrooms, and new building materials. Now PALCOCOAT makes it possible to achieve everyone's desire to protect their health and maintain the beauty and cleanness of buildings and living environments.

## What is a Photocatalyst?

Because of its characteristics of titanium oxide. strong oxidative decomposition occurs at the surface of the place where light energy of being like sunlight or room light hits and then various materials approaching to are broken down. Meanwhile the titanium dioxide itself does not change, so this reaction repeats every time light is received.

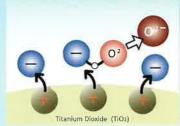

## What is Titanium Dioxide?

Titanium Dioxide

Titanium dioxide is a white powder (superfine particles) that has long been used as a white pigment. It is used for a wide variety of usages such as in coatings, dental material, toothpaste, and cosmetics. It is also used as a food additive for coloring in white chocolate, sweets, and chewing gums because it is tasteless, odorless, and is harmless to humans.

## **How Photocatalysis Works**

1 When Titanium dioxide eceives energy from light, electrons (-) are released from released are combined with oxygen in the air then creates "O2-" (Superoxide anion).

were released is tinged with the electric charge\*1 of plus, and takes electrons from moisture'2 of the air and then return to its original state. On the other hand, the moisture that lost the electron becomes a hydroxyl

3 The "O2-" and "•OH" that resulted in a process of transfer of this electron can produce strong oxidative decomposition, which decompose organic compounds such as oil causing dirt and adhesion, bacteria, harmful chemical gas, viruses, and molds even into simple harmless substances that

then are released into air.

\*1. This is referred to as an "Electron hole", and this is called as "Hole of plus (Electron hole)" or just a hole.

Photocatalyst Purification

**Photocatalyst** 

Antibacterial

Cleanliness

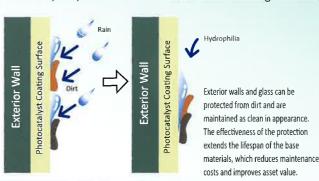

PALCCEAT is a coating system that uses "Photocatalysis" to purify the environment so that living environments can be kept clean thanks to its antibacterial effect.

## The Photocatalyst PALCCOAT® Used in Various Situations PALCCOAT®

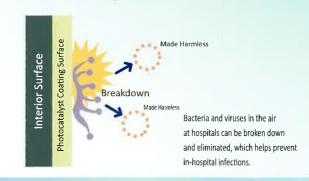

#### Function of Asset Maintenance (Self-Cleaning Function)

Rain Stains, Dirt, and Mold are Removed from Building Exteriors

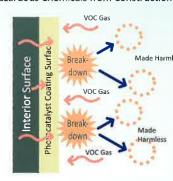

#### Function of Suppression of In-Hospital Infections

Function for Breaking Down Bacteria and Viruses in the Air

#### Function of Sick House Syndrome Countermeasure

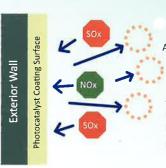

Hazardous Chemicals from Construction Materials are Broken Down

Formaldehyde, toluene, xylene, and other chemicals known to cause sick house syndrome are broken down into harmless ents, which reduces the indoor pollution concentration to below standard

#### Function of Environmental Purification Function

Harmful Contaminates in the Air are Broken Down

## **Benefits for Exterior Walls**

# 1. Maintaining Building Appearance

The cleanness of exterior walls is maintained by preventing dirt from attaching. After the coating is applied, dirt does not appear even after five years.

■Process of Breakdown / Dirt Elimination [Organic Material Decomposition Test (Red Ink Fading Test)]

The photos on the right show a time lapse for a white tile with the coating or the left half that is applied with a commercially available red ink.:

(Conditions: 20W UV lamp 1m above tile)

#### 2. Mold Suppression

The mold prevention function is effective on areas that receive limited UV light such such as north-facing walls and bathrooms.

An application test was conducted on a wall where mold already existed.

After eight weeks, a good result was found as shown in the photos on the right

## **Benefits for Interiors**

A new and improved version of the photoreactive type, which was already effective indoors. The composition ratio of the photoreactive sol was increased and silver ion was also added. The new VLAG for indoor use is effective even in rooms with thin light, and the silver ions maintain the sterilization and deodorization properties in dark areas.

#### 1. Deodorization

Various odors that are occurred during daily activities can become unpleasant when absorbed by walls, curtains and furniture. The photocatalyst repeatedly breaks down and eliminates such odors so that odor accumulation is suppressed, resulting in a more comfortable environment.

Example) Pet smells, cooking smells in kitchens, new car smell, body odor, etc.

#### 2. Sterilization

Bacteria and viruses such as coliform bacteria (O-157), staph aureus, bird flu, and Norovirus, which occur food poisoning, can be eliminated, and even dead bacteria (verotoxins) can be broken down and rendered harmless. Viruses can be reduced by 99.9%! [Table 2]

#### 3. Air Purification

Toxic volatile gases (VOCs) that can cause sick house syndrome are broken down and rendered harmless. In addition, NOx and SOx that cause air pollution can also be made harmless.

#### ■Antibacterial Test <Coliform> [Table 1]

	Number of Inoculations	After 18 Hours	Activity Value of Bacteriostasis
Nylon Cloth	logA 4.2	logB 5.6	
Cotton Cloth	logA 4.2	logB' 7.4	
LOHAS Towel	logA 4.2	logC 1,3	4,3

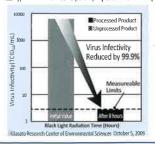

Sept. 9, 2005 Inspection Institute: Boken Quality Evaluation Institute Kinki Office

Antibacterial test using LOHAS Style by PALCCOAT towel

Test Method: According to JIS L 1902 Quantilative test bacteria emulsion absorption method, However, the washing method is according to the JIS L 0217103 test method. (JAFET standard detergent was used.)

Measurement method for viable bacteria count: Pour plate culture method (Note) Florescent light radiated for 18 hours during cultivation (about 5,500 lux)

■ Type A Influenza Virus (H1N1) Experimental Value [Table 2]

## Application Method

Application is made to indoor walls and ceilings and to exterior wall by spraying. Titanium dioxide reacts to light, resulting in various effects. Application can also be done using a roller or brush according to the situation.

### **Harmless Water-Soluble Coating Agent**

The photocatalyst coating agent PALCCOAT Standard Type contains only water-soluble titanium dioxide and pure water and is an environmentally friendly coating agent which is harmless to humans and animals, is onhazardous, and is nonflammable.

It has been proven to be harmless to humans and animals by a toxicity test,

**Long-Lasting Coating** 

There was no change in the weight of male mice according to the "Acute Toxicity Test Using Male Mice" safety test conducted by the Japan Food Research Laboratory.

#### Changes in Weight

Administered Group	Before Exposure	After Exposure (Days)	
Auministered Group	Belore Exposure	7	14
Study Group	27,0±0,8 (5)	29.7±0.7 (5)	31.4±1.7 (5)
Control Group	26,9±0,8(5)	29.7±1.3 (5)	1,9±1,8(5)

Weight is expressed using the average  $\pm$  standard deviation (Unit: g),

No abnormalities were found in the "Mutation Test" or "Primary Skin Irritation Test Conducted on Rabbits."

High degradation is possible even in the visible light range (410nm to 490nm).

The deodorization and sterilization functions also work indoors.

JIS D 0205:1987 Test Method of Weatherability for Automotive Parts

According to WAN-IS(H)

Black Panel Temperature: 63 Degrees

Test Time: 3,000 hours

No abnormalities were found from testing conducted using the above conditions.

\* A 9.000 lux white florescent light was used.

#### **Effective Even with Interior Lights**

As with the red ink tile test stated on the left page, it was confirmed that red ink can be broken down according to a test using visible light.

The formed coating cannot be peeled off by rain or wind once it has

dried for two hours. After this, the coating continues to harden, and

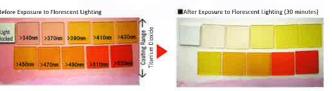

after a few weeks the hardness becomes stable at a pencil hardness

This coating is strong and can withstand harsh natural conditions,

Pigment degradation with a short wavelength cutoff filter

and can maintain its effectiveness for a long time.

\*Differs according to the temperature and humidity

ection Institute: SAGA Ceramics Research Laboratory

## **Certification System by the Photocatalysis Industry Association of Japan**

The Photocatalysis Industry Association of Japan (PIAJ) established their criteria for evaluating photocatalyst materials and their applied products in order to improve product quality and performance. They also operate the certification system for forming a healthy photocatalyst market.

1 Product Name	PALCCOAT ST				
2 Photocatalyst Type	Titanium Dioxide				
3 Photocatalyst Processed Portion	Organic coated surfaces, inorganic coated surfaces, tiles surfaces, and glass surfaces				
4 Effect of the Photoca	talyst				
Self-Cleaning Effect	Measurement method is according to JISR1703-1 and JISR1703-2				
	Contact Angle*1	Organic Coating: Less than 11.7° Tile: Less than 5° Inorganic Coating: Less than 5° Glass: Less than 5°	This is the index for dirt breakdown performance.		
	Decomposition Activity Index*1	Organic Coating: 20,0 Tile: 12.6 Inorganic Coating: 21.3 Glass: 12.6	This is the index for dirt breakdown performance.		
5 Location Used	Outdoors				
6 Safety	Acute oral toxicity, primary skin irritation, and mutagenicity have been confirmed to meet the safety standards set by the Photocatalysis Industry Association of Japan.				
Cautions for Usage	If too much dirt is attached to a surface, sufficient self-cleaning effect cannot be achieved, so regular cleaning is recommended.				

The PIAJ mark is the certification mark given to photocatalyst products that meet standard values, PALCCOAT ST acquired the following PIAJ mark for "Self-Cleaning" performance.

\*1 According to the certification criteria set by the Photocatalysis Industry Association of Japan, the contact angle should be 30° or less, with a smaller contact angle indicating better performance. Certification requires a decomposition activity index of 5 or higher, with a higher index indicating better performance.

## Lecture for Photocatalyst Coating Technology Using Water-Soluble Titanium Dioxide

Attendants listened carefully to Dr. Ichinose in a study group

A patent for "Anatase Dispersion and its Manufacturing Method" invented by Dr. Ichinose was granted in January of 1999. Further study of photocatalysis technology has progressed, and newly developed technologies have allowed for a wider range of applications.

SAGA Ceramics Research Laboratory
Fellow Researchers - Doctor of Engineering, Hiromichi Ichinose
Developer of the water-soluble itanium dioxide coating agent
for promoting science and technology in 2001, he received an
a

Certification requires a decomposition activity index of 5 or higher, with a higher index indicating bett Expressed according to the guidelines set by the Photocatalysis Industry Association of Japan.

# Photocatalyst Coating Examples of Construction Using PALCOAT has a proven track record, and can be used to fill various needs.

### Benefits of Photocatalyst Coatings

Maintains Appearance / Improves Asset Value / Purifies the Environment / Eliminates Odors / Sterilizes / Prevents Yellowish / Countermeasure for Sick House Syndrome

## JR Nishi-Funabashi Station Building

## **Coating on the Nationwide University Cooperation Building**

CITITY SEATTHER STREET

A sign was posted related to the coating to appeal mental protection measures

## Washing and Coating Exterior Walls of a Food Processing Plant

## PALCOAT has replied to various needs of customers with sufficient track record and confidence from them.

JR Matsumoto Station

New construction of the Matsumoto Station

Prevents rain stains and color fading

Exterior Wall of a New Restaurant

Appearance can be maintained. which improves the occupancy rate

School Facilities

Originality can be maintained

Construction Equipment Leasing Company

Countermeasure for Sick School Syndrome at an elementary school in Tokyo

Retirement Homes

Appearance can be maintained for years by

applying a coating to home exteriors

Sterilization and odor elimination

Countermeasure for Sick House Syndrome before movement

Application to steel sheets

**Hotel Rooms** 

Cleanliness from the sterilization and deodorization properties can be appealed

#### Hotel Kitchens

Air purification at a sake brewery

provides a sense of safety

Coatings on Clothes

Used by many dry cleaners

Photocatalyst Coated Mask

Flu virus can be broken down and eliminated

provides a comfortable space for customers

Elimination of new car smell (VOC gas) in a kindergarten bus Air purification inside of buses and prevention of motion sickness
